BODY MOUNTING-- CHASSIS SUPPORT

The J2 tub sits on the chassis and is secured to it by three bolts on each side. The front mount is just behind the brake cross shaft. The center mount is at the rear road spring front pivot. The rear mount is a ear on the front part of the battery rack, about 4 inches or so behind the rear axle.

Just to the rear of the bulk head there is-a "U" shaped flat iron bracket which is there to secure the lower side valance which extends from the tub forward to the chassis and provides the covering below the bonnet.
