FOOTBRAKE ADJUSTMENT PLATE

About all that I know is somewhere under the floormate on the driver's side of the car is (and in most cases probably was) a brass plate telling the operator how to adjust the foot brake pedal.

I do not know what the size of this plate was.

I do not know where this plate was located.

If this plate was located under the floor mate on the driver's side, then that means that there was also a access hole there to allow the operator to adjust the "wing nut" (fly nut, as the English called it).

I need to know about the plate!

I need to know about its location!

I need to know about the access hole!

I need to re-write this technical article!

HELP !!!!!!!!!!!
