CHOKE AND SLOW RUN CONTROLS

In response to a couple questions I am providing some pictures of the slow running control and the choke or mixture control. The special support bracket which is mounted on the remote shift control arm is made from an aluminum plate. The left rod is the slow running control and the right rod is the mixture control. Riveted onto the support bracket are two brass plates with the usual black engraved working. The linkage on the driver's side of the fire wall looks like the picture below.
