MORE ON THE VACUUME OPERATED WIPER SYSTEM

John writes:

"The induction manifold on my engine has a nipple threaded into the large brass plug. I found this connected to the rubber hose going to the suction wiper motor. The nipple comes somewhat close to the carburettor linkage between the carburettors but does not hit. I have found no other location for this connection."

Note from the editor -----

I do not know John, your guess is as good as mine. Lets see if others can add to the confusion. I will re-write this article if we can ever get enough information to come to some conclusion.

More ---

One of the English "authorities" states that he has seen a suction type wiper motor system with the brass union fitted to the rear of the manifold as shown below. That makes about the fourth suggested location!
